Why a Planttubby?

A wicking system distributes the right amount of water to keep the potting mix at a consistent moisture level. This ensures that your plant is not overwatered during - or dries out between watering sessions, creating the perfect conditions for a healthier root system. The reservoir section prevents water from flowing away, and the lid keeps the moisture inside for longer. This saves water and also stores some water for when you are away.

How it works

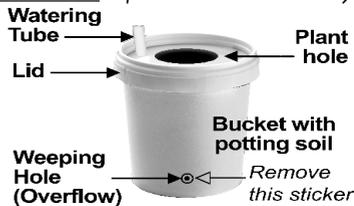

The plant is watered through the watering tube until it overflows at the "weeping hole". Extra water is stored in the reservoir part of the bucket until needed. The "soil foot" or wick area is in the water and basically sucks water out of the reservoir as needed and delivers it to the potting mix.

Tips

- PLEASE NOTE:** Moisture will not be spread right to the top, so ensure that the roots of the new plant will reach at least 10cm deep. If not, then water the plant through the hole in the lid until it is big enough to reach.
- Place a planter saucer under your Planttubby if need be or if it's kept indoors, to catch the water from the weeping hole.
- When feeding the plant through the hole in the lid, add a bit of water at the top to ensure it dissolves into the potting mix.
- Keep your Planttubby in a mostly shaded area to get the longest lifespan from it. The lid and handle might become brittle over time, but the bucket itself will last for years in some shade.

Instructions

(See video on website)

- Remove the small sticker over the "weeping hole" on the front side of your Planttubby.
- Remove the tape and circle insert in the lid.
- Plant your new plant in the circle in the potting mix. DO NOT remove the lid. Ensure your plant will fit through the circle cut in the lid. Remove some of the potting mix to create a hole big and deep enough for your new plant (not exceeding 15cm deep).
- Remove your new plant from its container and remove any extra soil from the plant. Carefully loosen some of the roots on the outside and bottom.
- Plant your new plant through the hole in the lid and fill the mix around the plant if needed from the mix you removed.
- Important:** To "activate" the system, drench the potting mix through the hole in the lid for the first 3 watering sessions and leave it for 30 minutes between sessions and with approximately 1 to 1.5L of water per session. Add some of the potting mix as need be between the watering sessions. Once the new plant and grow mix is settled, then fill the watering reservoir as mentioned hereunder. For the first 1-3 weeks after planting (depending on the speed of root growth of the specific plant), water from the top through the lid as well to ensure the roots grow deep enough to benefit from the wicking zone. Once your plant is settled, you only need to fill the reservoir as explained through the fill tube.
- Remove the tape and reusable insert / cap from the watering tube. Water the plant slowly through the tube when needed and stop the moment the water comes out of the "weeping hole". Replace the cap.
- Add some potting mix if needed over time.
- Avoid keeping Planttubby in direct sunlight all day, as
